Example: What is a Custodian Bank? A custodian bank is a special financial institution that carries the responsibility for protecting the financial assets of individuals or companies. These institutions can also be called simply custodians. Such outfits serve as a third party check that protects the assets they are guarding against the fund managers and any illegal activities they may pursue. Congress established these custodian banks with the Investment Company Act of 1940 in order to protect investors. Thanks to this particular legislation, investment companies must adhere to specific stringent listing requirements and must be registered with the Securities and Exchange Commission. The

custodian bank performs a number of activities in their primary function of watching over the financial assets of businesses and individuals. They settle sales and purchases of bonds and equities and physically protect the certificates of these assets. These institutions also gather information about and income from such assets. When the assets are stocks this means dividends. When the instruments are bonds, they collect the interest from the coupons. The custodians also disperse information they gather, pertaining to yearly general meetings and shareholder voting. They handle any foreign exchange transfers as necessary and manage all cash transactions. Finally, custodians deliver routine reports on their various activities to the customers. Custodians banks provide reports on every trade or deal which they transact on behalf of the clients. They must be consistently delivered. Along with these reports they furnish information on the companies whose assets they hold besides information on general meetings.

When a custodian is holding foreign shares or bonds, they will also have to change currencies as necessary. This is the case when the fund manager buys or sells foreign currency assets. It is also necessary when companies pay out dividends or bonds receive interest with these overseas financial instruments. Custodian banks are a critical component of the modern investment environment. Without them to carry out these functions, all of the important financial record keeping and housekeeping items would be neglected. Not all custodian banks are national operations in the United States. A number of the major international financial institutions offer these services around the globe. It is based on common usage as practiced by financial professionals. Compiled over the last 3 years from questions and feedback to financial articles published by the Wealth Building Course education program. Principles of Corporate

It also covers the lingo that was introduced in the financial crisis of 2008 until 2017. With the alphabetical order it makes it quick and easy to find what you are looking for. Financial Dictionary Series Additional financial dictionaries are available in this series. Please also check out: Accounting, Banking, Retirement, Economics, Investments, Laws & Regulations, Acronyms, Real Estate & Trading. Click on the author name to see them. Example: What is Market Capitalization? Market capitalization refers to a company's total value. Analysts determine it by multiplying the number of shares in existence times the price of the stock. This concept can also be utilized to measure the full value of a stock exchange. The New York Stock Exchange market capitalization would equal the value of all publicly traded companies on the exchange added together.

Market cap is another name for market capitalization. Examples of how this is figured make it easier to understand. Companies that have 2 million shares which have been issued that sell for \$20 apiece have a market cap of \$40 million. If an investor had enough money and could get the stockholders to agree to sell their shares, he or she could purchase the company for \$40 million total. In practice many shareholders would want more than the current share price to sell their stock. There are three different main sizes of market capitalization among traded companies. These are large cap, mid cap, and small cap corporations. Large cap companies are generally considered the least risky ones in which to invest. They typically possess substantial financial resources to survive economic downturns. They are also generally leaders in their industries. This gives them a smaller amount of growth opportunity. Because of this the returns for these large cap companies are often not as spectacular as with

successful companies in the other two categories. They also have a significantly greater chance of paying dividends out to their share holders. Large cap corporations have \$5 billion and higher capitalization. Mid cap companies are generally less risky than the smaller companies. They still do not have the same possibilities for aggressive growth. Mid cap companies commonly possess market capitalization of from \$1 billion to \$5 billion. Studies have shown that mid caps have outperformed large cap and small cap corporation stocks in the past 20 years. Small cap corporations are those which possess under \$1 billion in market capitalization. These tinier companies have often completed an Initial Public Offering in the recent past. Such companies are considered the riskiest of the three types. This is because in economic downturns, they have the greatest chance of failing or defaulting. They also enjoy plenty of opportunity and space to expand. This means that they potentially could

be extremely profitable if they succeed. Note: This example description is shorted due to publish restrictions. Each term is explained with 600 words and more.

The Price of Government - David Osborne
2009-04-29

Government is broke. The 2004 federal deficit is the highest in U.S. history. The states have suffered three years of record shortfalls. Cities, counties, and school districts are laying off policemen and teachers, closing schools, and cutting services. But the fiscal pain won't go away, and the bankrupt ideologies of left and right offer little guidance. *The Price of Government* presents a radically different approach to budgeting—one that focuses on buying results for citizens rather than cutting or adding to last year's spending programs. It advocates consolidation, competition, customer choice, and a relentless focus on results to save millions while improving public services.

It contains terminology relating to the IMF's organization and operations, as well as from the Articles of Agreement, By-Laws, Rules and Regulations, and other major IMF publications. Example: What is Currency Trading? Currency trading is speculating on the largest financial market on earth. Despite the fact that this is the world's largest, most liquid, and most impressive market, many individual traders do not know much about it. This is mostly because until Internet trading became popular, access to these markets was limited. Only the large banks, multinational businesses, and shadowy hedge funds were able to trade them. Today the

currency markets trade 24 hours per day, 6 days per week. This several trillion dollar market trades on every continent. Trillions of dollars per day change hands in the foreign exchange marketplace. All of this combines to make currency trading markets the most easily accessed on earth. This speculative currency trading is not the main reason that the Forex, or Foreign Exchange, markets exist. They were set up to help big international companies change currencies from one kind to another. Many of these corporations need to trade currency constantly to pay for such costs as international goods and services payments, payroll, and acquisitions overseas. Despite the origins of these currency markets, only around 20% of the total market volume comes from these company trades. An incredible 80% of the daily trades in the currency markets are from speculative currency trading hedge funds, large banks, and individual investors who want to take a position on one of the major currency pairs. Currency

traders are able to engage in these markets without many of the constraints that plague the stock markets. If individuals believe that the GBP/USD pair will drop dramatically, they are able to short sell as much of the currency pair as they desire. There are no uptick rules with currency trading. There are similarly no position size limits in currency trading. Traders could buy tens of billions of any currency pair if they had the money to cover the trade. There are also no rules on insider trading with this type of currency trading. It does not exist. Economic data in Europe is routinely leaked several days ahead of the official release date. Another way that currency markets are different from stock markets is that there are no commissions in foreign exchange markets. All currency companies are dealers. These dealers take on the counterparty currency in any trade. They earn their money with the spreads between the bid, the cost to buy the currency pair, and the ask, the cost to sell it. Note: This example

description is shortened due to publishing restrictions. Each term is explained with 600 words and more.
